Not illustrated. 1905 Excerpt: . . . to excite the machine, and another part is lost in the armature winding (ohmic loss). With a motor, of the electrical energy supplied a part is lost in exciting the machine and overcoming the ohmic resistance of its armature. The remainder is transformed into mechanical energy, from which, however, a part is lost in overcoming the mechanical and magnetic resistances. Hence three different kinds of efficiencies may be considered, viz. the mechanical, electrical, and combined or total efficiencies. The mechanical efficiency is of no special interest, and whilst in some cases the electrical efficiency is important, in all cases the combined, total, or commercial efficiency is of the greatest importance. i. The Electrical Efficiency As stated above, the electrical efficiency (η_e) is the ratio between the electrical energy delivered to that consumed. Let P_c be the electrical energy consumed. P_d delivered. r_a armature resistance (total, including the contact and brush resistance). r shunt resistance. C_a armature current. C_m shunt current. r resistance of the series winding. Then--
 $P_d = I_a V_T$; (23) for shunt machines, $\eta_e = \frac{P_d}{P_c} = \frac{I_a V_T}{I_a^2 r_a + I_a V_T}$ (24) for series machines, and $\eta_e = \frac{P_d}{P_c} = \frac{I_a V_T}{I_a^2 r_a + I_a V_T + I_m^2 r}$ (25) for compound machines. Hence the electrical efficiency of a machine becomes determinable when the resistances of the armature and field coils are known. The measurement of these resistances is described in Chapter II. In the following are three examples for determining respectively the electrical efficiency of (a) A shunt machine. (1) A series (e) A compound (a) Shunt Machine....
