Field tested and proven Requires expertise to plan, collect, and interpret data Data subject to interference from soil moisture or clay in the subsurface May be problematic in iron-rich, deeply weathered soils Historical information for PG and Es Chico former MGP site indicated multiple locations for the buried former feedstock tank. Ground-penetrating radar was used in conjunction with EMS to determine whether the tank still existed and to verify its location (in order to determine whether soil contamination observed in an area might be from the tank or from a different former MGP structure). Although there was significant interference in the EMS survey from an adjacent substation, the GPR survey placed the location of the former buried feedstock tank farther west than the location estimated from historical Sanborn Fire Insurance maps. Interpretation of the survey data identified the location of the tank excavation but was not able to confirm whether or not the tank was still in place. Robert Doss, Pacific Gas and Electric Company, (415) 973-7601 Magnetometry is a nonintrusive electromagnetic geophysical surveying technique commonly used in the construction industry to detect and map buried drums, metallic pipes, utilities, cables, and piping before excavation, demolition and or construction. This technology has also been applied to former MGP sites to identify buried utilities before drilling and to survey and map historical MGP structures such as buried piping, tanks, and other metal structures. Magnetometer surveys use an instrument that measures the varying intensity of magnetic fields produced by buried metallic objects. The magnetic readings produced by the magnetometer can be interpreted so that conclusions can be drawn about...
